

Oil Refinery

Oil refinery produces gasoline, kerosine, and diesel oil by using petroleum. This industry is so important in that it is the energy source of the whole society and takes responsibility of lowering energy consumption and increasing utilization efficiency. It influences directly on energy security, economic development and establishment of saving society. Oil refining capacity of China has increased dramatically and became the second largest oil producer only to the USA in 2006. Currently, oil refinery in China usually applies producing technical procedures of reduced pressure distillation, catalytic cracking, catalytic reforming, hydrocracking, delaying coking etc. for the refining of crude oil and gas distillate.

V-Flo has long established relationships with excellent chemical design institute in China and is capable of contracting oil refinery plant building and expanding. We also supply all equipments, materials, gauges, chemicals, catalytic agent, commissioning and installing. New plant establishment of 10000BPSD Condensate Refinery of Baniyas Refinery Company from Syria and reformation oil refinery project of Homs are under methodical progress.
